

I'm not robot

Continue

userLoggedIn = correct; } Angles will be responsible for converting * ngIf syntax to what we are just looking at, stretching the system. Besides, we both know that it's not a monitored solution. However, it will tell you more about how [ngIf] plays. Here we are deft to the syntax binding of the treasure here. Moreover, yes, it shows that we will be able to deliver ngIfThen, ngIfElse and *ngIf in the same way.<code><ng-template [ngIf]=userLoggedIn [ngIfelse]=userloggedOut><div>Hello User</ng-template></ng-template #userloggedout=><div>User Login </ng-template></code>Well, we don't need to jump ahead in this fashion. We still don't cover ngIfThen. Here we move *template ngIf outside. That's all that's meant. What is this interest? Well, it offers increased flexibility in certain use cases. We'll be able to change the reference to the template to then dynamically. Alternatively, in other words, we will <code><ng-template></ng-template></code>swap if necessary. However, one must bear in mind that it is a less frequent use. The best thing about this approach is that you will be able to produce more descriptive if/then/one more segment. Here we explore priorities and case as stated by already.<code>@Component({ voter: 'my <ng-container *ngIf=isLoggedIn; then userloggedIn; user elseloggedOut></ng-container></code>template: '<ng-template #userloggedin=></div><div>User Hello </div></ng-template></ng-template #userloggedout=></div></div></code>Please Log In </div></ng-template>'; }) export the AppComponent class { userLoggedIn = correct; } Here the thinking in the flow of reality has become accustomed to syntax. It aligns with our thoughts, like this: ngIf = circumstances? then : other; Choosing the former ng is an option in this case. Well, we make sure that the DOM node is not given until the template has been given. Additionally, when using later blocks, the content included in the opening and closing tags is ignored. We have described the same thing in the example above involving <code><ng-container></ng-container></code>.
